Product description:

GENMAC Infinity-Rent G15KS-M5 THREE-PHASE GENERATOR 15,4KVA

The generator GENMAC Infinity-Rent G15KS-M5 three-phase is equipped with a Kohler diesel-powered engine capable of delivering a power of 15,4KVA with AVR voltage regulator.

The generator is equipped with an oversized Kohler engine capable of delivering a continuous power of 14.4KVA and a maximum power of 15,4KVA. Thanks to the 50l tank the Genmac Infinity generator has an autonomy of up to 14 hours of work.

The Genmac generator silenced has been realized with a high performance frame to minimize the sound pressure. The frame is made with steel plates made according to UNI S235JR standards, complete with rubber anti-vibration supports. In order to improve the handling before use, at the base of the generator there are bilateral steel pockets for forklift trucks, which allows lifting from all sides, and on the top of the generator there is a hook for central lifting.

The 15,4KVA generator is complete with 4 doors that allow easy access for ordinary or extraordinary maintenance. In order to make this Genmac generator as quiet as possible, 100% recyclable, fireproof, self-extinguishing, fireproof, washable, class 1 reaction to fire, mechanically fixed to the frame.

The Genmac Infinity-Rent silenced generator specific for mobile and rental applications. Easy to use and move. It mounts the latest generation engine with low emissions, for energy that respects the environment.

AVR Voltage Regulator

The AVR is essential to make the generator work at its best, in fact it all needs an electronic control system, an AVR in fact, which ensures the proper functioning of the machine and the electrical network behind it.

The purpose of the AVR, in a current generator, is to keep the output stable. And if its operation is very simple when resistive loads are fed, more complex is the matter in case of mainly inductive loads: the delayed phase shift current counteracts the inductor magnetic field, causing a voltage drop at the alternator terminals; to compensate for this phenomenon, the AVR intervenes automatically by increasing the excitation current, until it returns to the nominal value. If the load is capacitive, the current acts as a magnetizer for the inductor causing an increase in voltage exit, and the AVR intervenes by reducing the excitation current.
